How to Effectively Implement Security Management in DevOps

Modality: Self-Paced Learning

Duration: 1 Hour

For any organization working through the DevOps process, security is essential to safeguard every single element involved in this process. For this, one needs to understand the ways in which DevOps based security can be implemented to achieve this aim and the different aspects like policies, processes and strategies through which this aim will be realized.

About the Course:

The entire DevOps environment requires intensive security in order to function properly and without having any issues that might hamper the overall development process leading to delays. DevOps security is an aspect of DevOps that deals with the security related infrastructure, policies and processes related to maintaining top grade security in such DevOps environments. This course will help you understand the ways in which you can incorporate this security at every single stage of DevOps ranging from initial ideation to the final release.

Course Outline:
